

Nutrition

- Range of diets eaten*
- Nutritional requirements
- How does an insects gain the required nutrients

**Nutrient
demand**

**Nutrient
supply**

← **balance** →

→ Evolutionary
→ Day to day

→ **Feeding type:** Plant/Animal
associated morphology and
physiology

→ **Life history stage:** Reproductive/non
reproductive

→ **Dietary history:** last meal(s)

→ **Pre-ingestive choices**
meal type and size

→ **Post-ingestive processing**
morphology of mouthparts/gut
selective absorption/excretion

Nutritional requirements

Nutrition = chemicals required for growth, tissue maintenance, reproduction and all other life activities

Is the outcome of **ingestion, digestion, absorption, metabolism** and **excretion**

- Ingested
- Synthesized by the insect
- Symbionts

Macronutrients

- Nitrogen (10 a.a.): proteins and amino acids
- Energy source - carbohydrate, fat, protein
- Fatty acids
- Sterols (cholesterol or plant sterols)

Micronutrients

- Vitamins (vitamins B's, A, C & E)
- Mineral ions

Nitrogen

Amino acids \Longrightarrow Proteins

- Structural purposes
- Enzymes
- Transport and storage
- Receptor molecules
- Cuticular sclerotization (aromatic amino acids)

Nitrogen

Amino acids \Longrightarrow Proteins

Need 20 amino acids

- 10 amino acids essential

- the other 10 can be synthesized

= TRANSAMINATION (transfer of an amino acid group from a pre-existing amino acid)

Carbohydrates

- Chitin
 - Energy
-
- $(\text{CH}_2\text{O})_n$
 - Simple carbohydrates (mono & di-saccharides)
e.g. glucose, fructose, sucrose (gluc + fruc), maltose (gluc+ gluc)
 - Complex carbohydrates (polysaccharides)
e.g. glycogen, starch, cellulose

Lipids

- Fatty acids
 - Phospholipids
 - Sterols
-
- Fatty acids - $C_nH_{2n+1}COOH$
 - Two forms - saturated (no double bonds) and
 - unsaturated (1 or more double bonds)
 - Cell membranes
 - Moulting and Reproduction
 - Energy storage e.g. Long distance migration (flight)

Sterols

- Affects development and morphology
- Precursors of the steroid hormones
 - e.g. ecdysone
- Cellular membranes
 - Essential structural components (provides support and rigidity)

Micronutrients

Vitamins

Visual pigments

reproduction

- Fat soluble (e.g. provitamin A, vitamin E)
- Water soluble (e.g. B-vitamins)

Can not be synthesized
Enzyme cofactors

Ascorbic acid

Nucleic acids

Inorganic compounds

- e.g. Sodium, potassium, calcium, magnesium, chloride and phosphate

Metals

- Iron, zinc, magnesium

Nutrient balance matters

Evolutionary

Day to day

Nutrient balance matters

Example: Australian plague locust
5th instar

Optimal
P:C ratio

Decreased growth rate

- nutrients diluted
- suboptimal ratio P:C

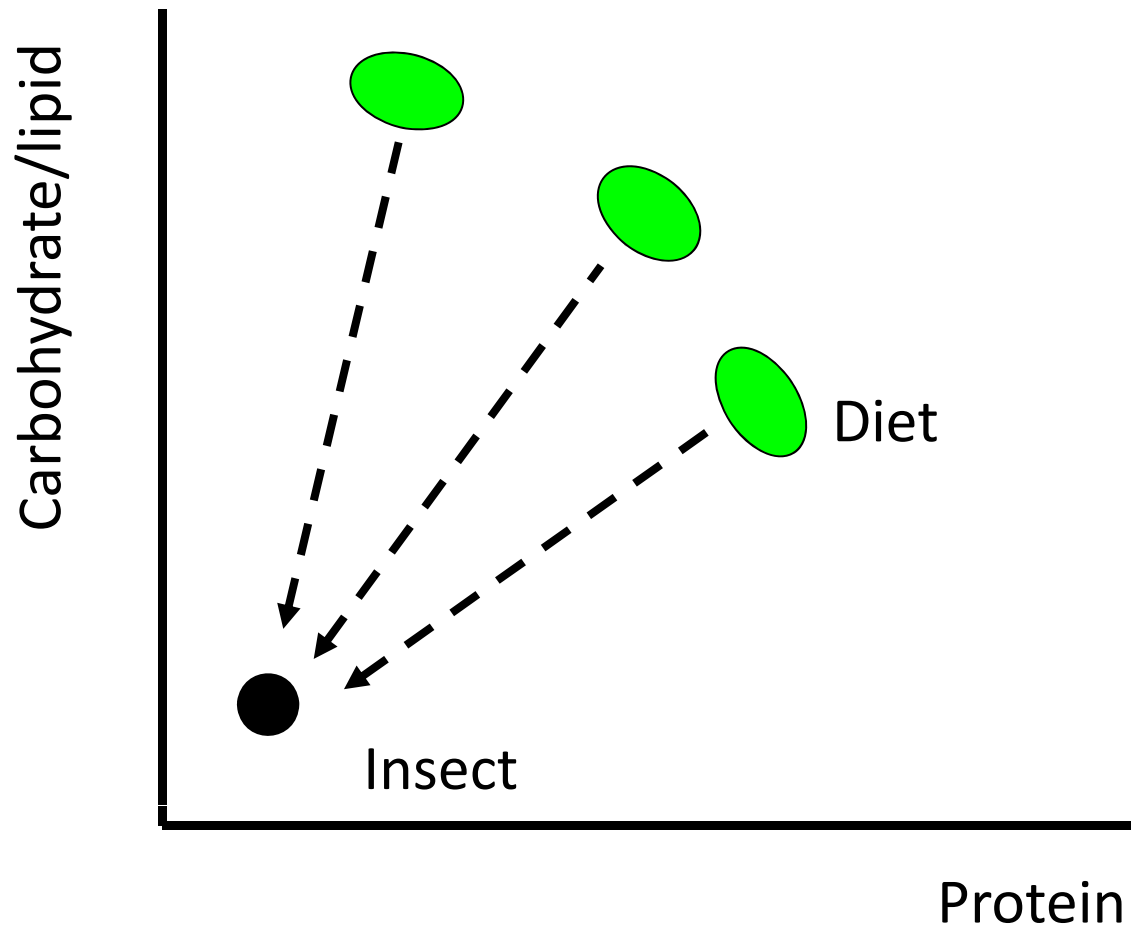

Nutrient balance matters

Between macronutrients

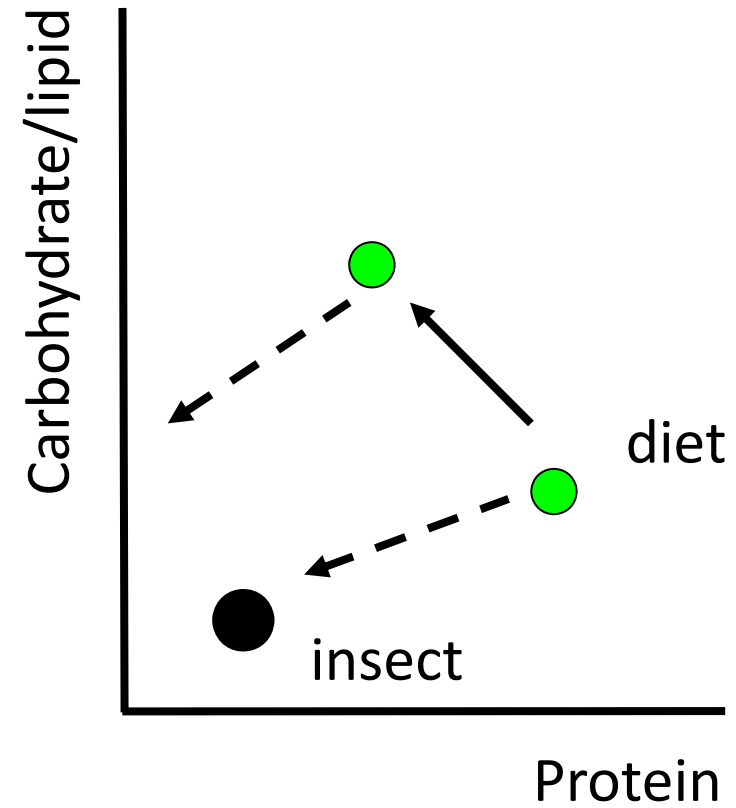

- protein versus carbohydrate

Nutrient composition of diet

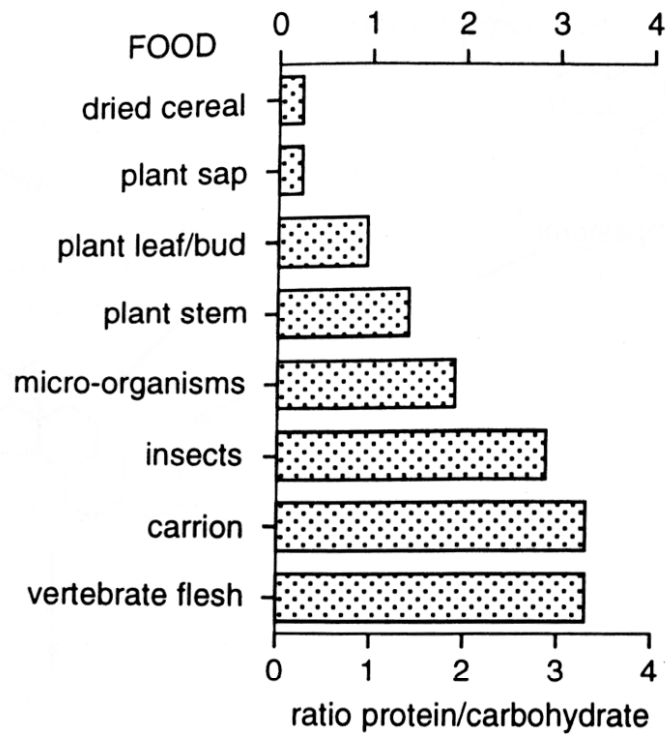

Nutrient composition of diet

Nutrient balance matters

Between macronutrients

- protein versus carbohydrate

Within macro nutrients

- amino acid balance

Nutrient balance matters

Nutrition = chemicals required for growth, tissue maintenance, reproduction and all other life activities

Is the outcome of **ingestion, digestion, absorption, metabolism** and **excretion**

$$***NUTRITION = IN - OUT***$$

Pre – ingestive balancing

Choose

- What to eat
- Amount – meal size
- Frequency – meal frequency

Foods contain all the necessary chemicals but not in the correct balance

Which nutrients to regulate?

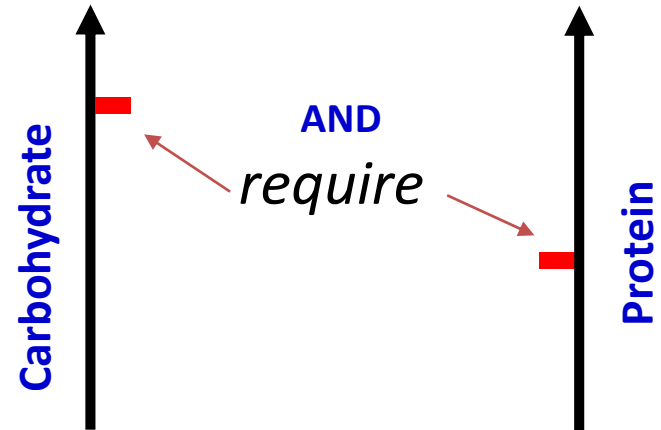

Nutrient requirements

- multiple nutrients

Protein

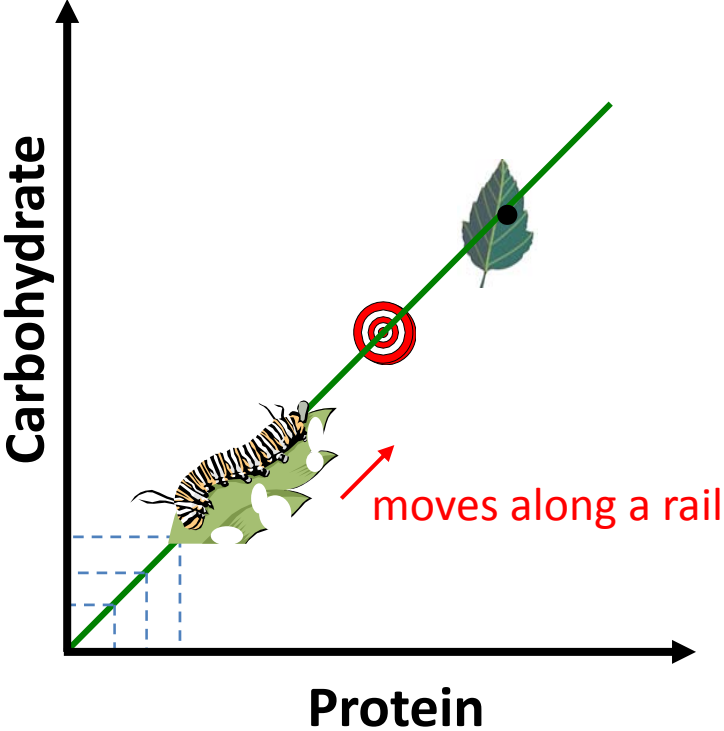

Carbohydrate

- nutrient *interactions*

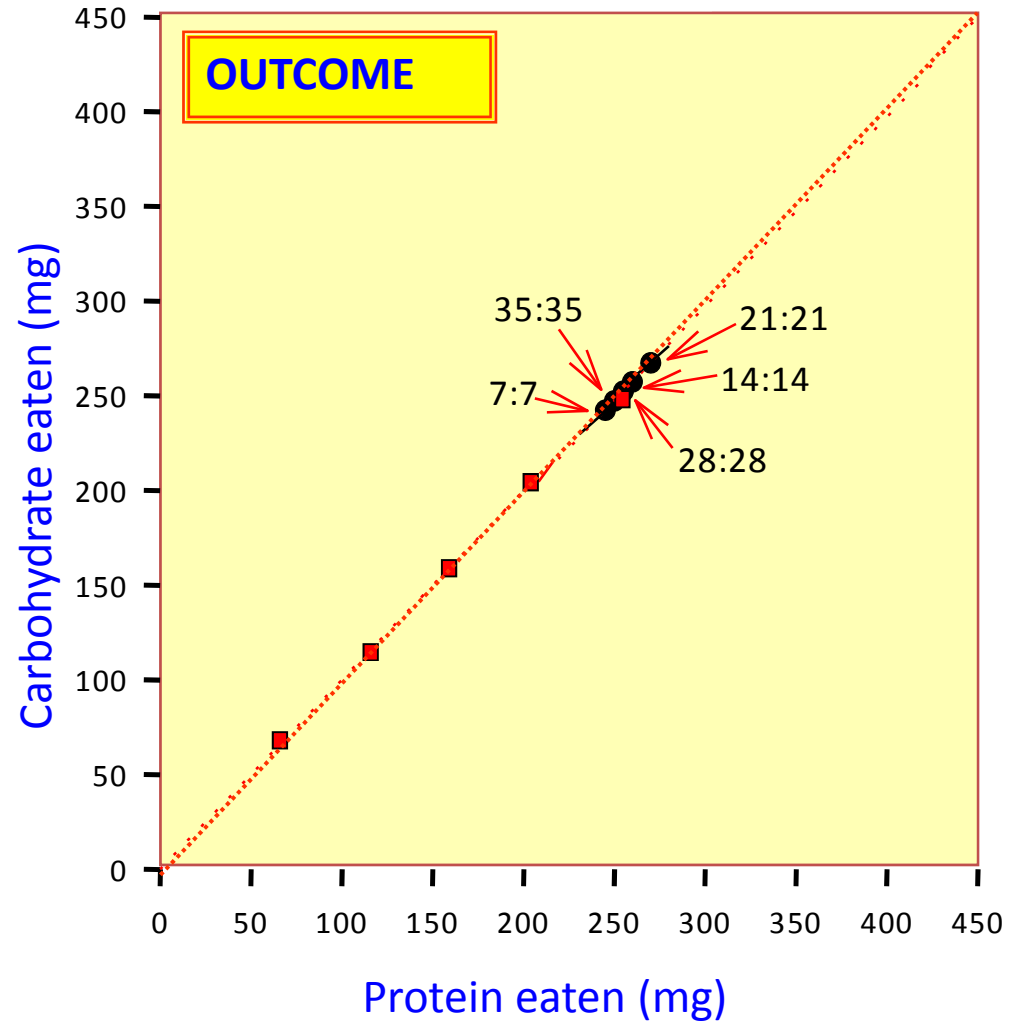

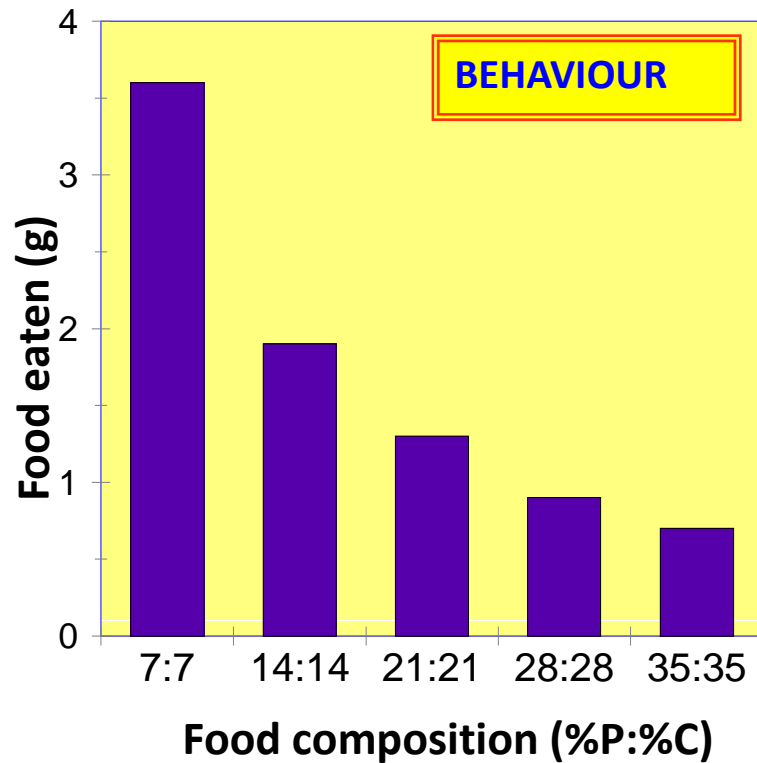

a) Balanced food

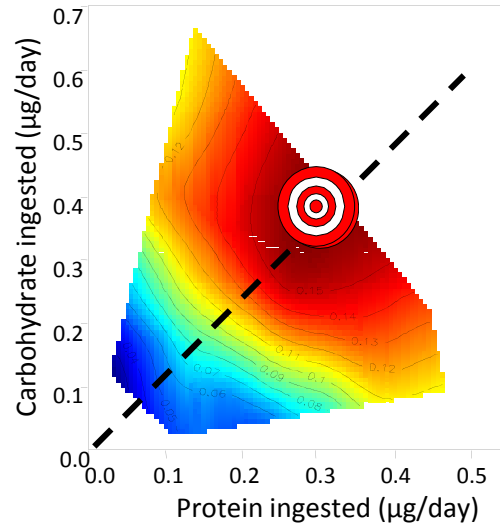

Nutrient dilution

Manipulation:

- Diluted, 5-fold range

b) Multiple foods

Powerful test of target defence

- Undefended

- Defended – *active regulation*

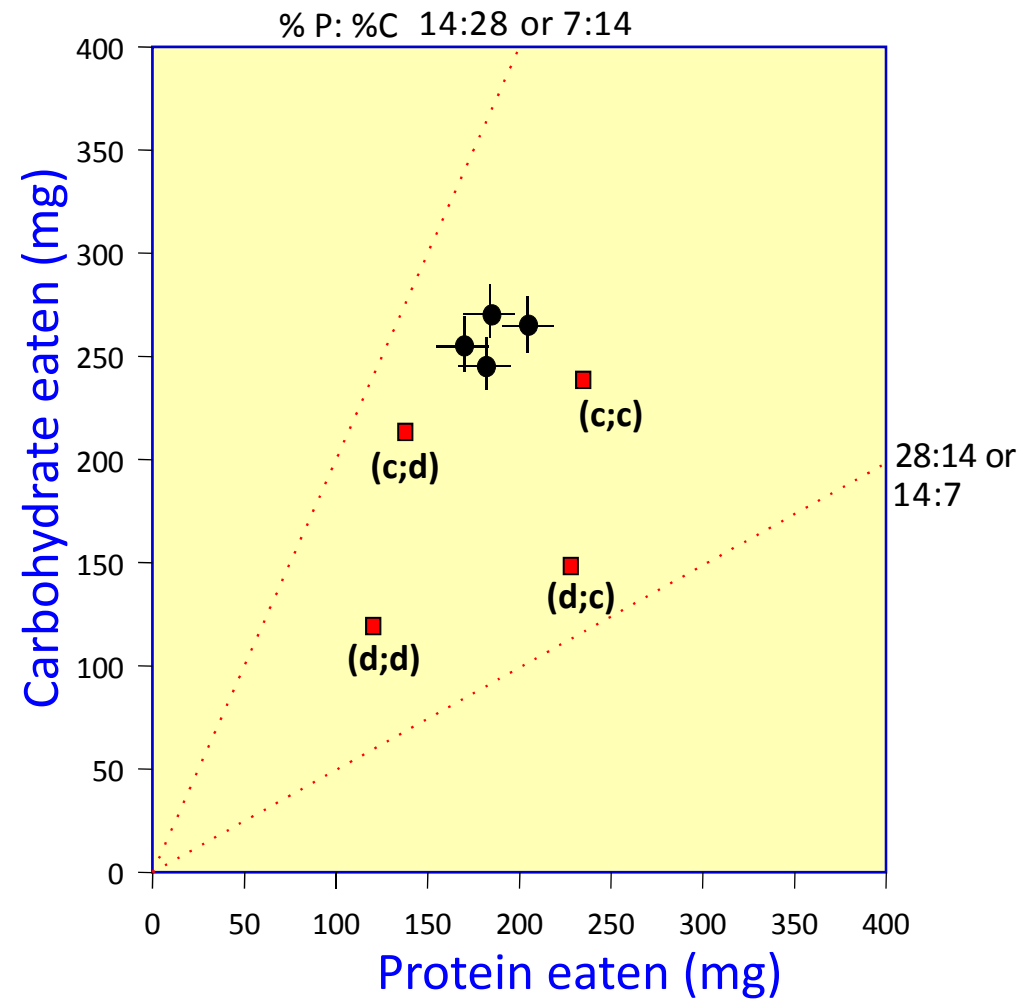

African migratory locust - *Locusta*

Manipulation:

Two synthetic foods each,
% **P**, **C** and **bulk** different

Nutrient requirements

Can meet nutritional requirements

Pre-ingestive

- What is eaten
- Meal size
- Meal frequently

But life not that easy

Host range for many insects restricted

Nutrient requirements

Growth and Rate of Development

Decreased growth rate

- nutrients diluted
- suboptimal ratio P:C

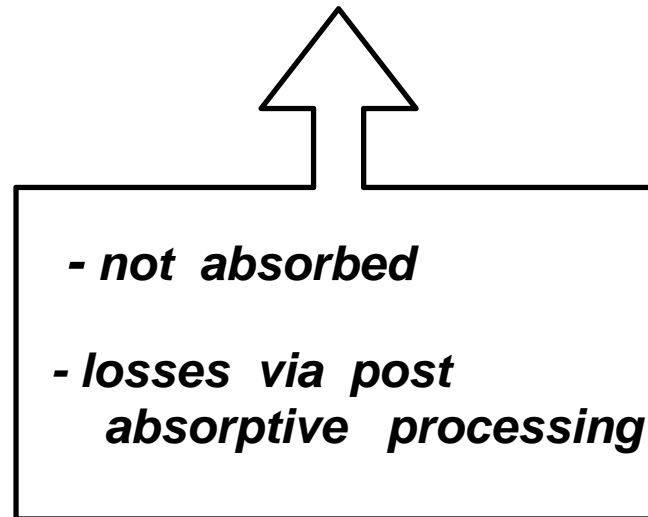

- Performance unaffected over a range of P:C ratios
- Similar body compositions

Foraging

Acquiring the correct blend of nutrients

$$\mathbf{NUTRITION = IN - OUT}$$

Examples

- morphological
- physiological

Example: *morphological*

NUTRITION = IN - OUT - not absorbed

Modification of gut

Phloem feeders:

e.g. aphids, psyllids, scale insects

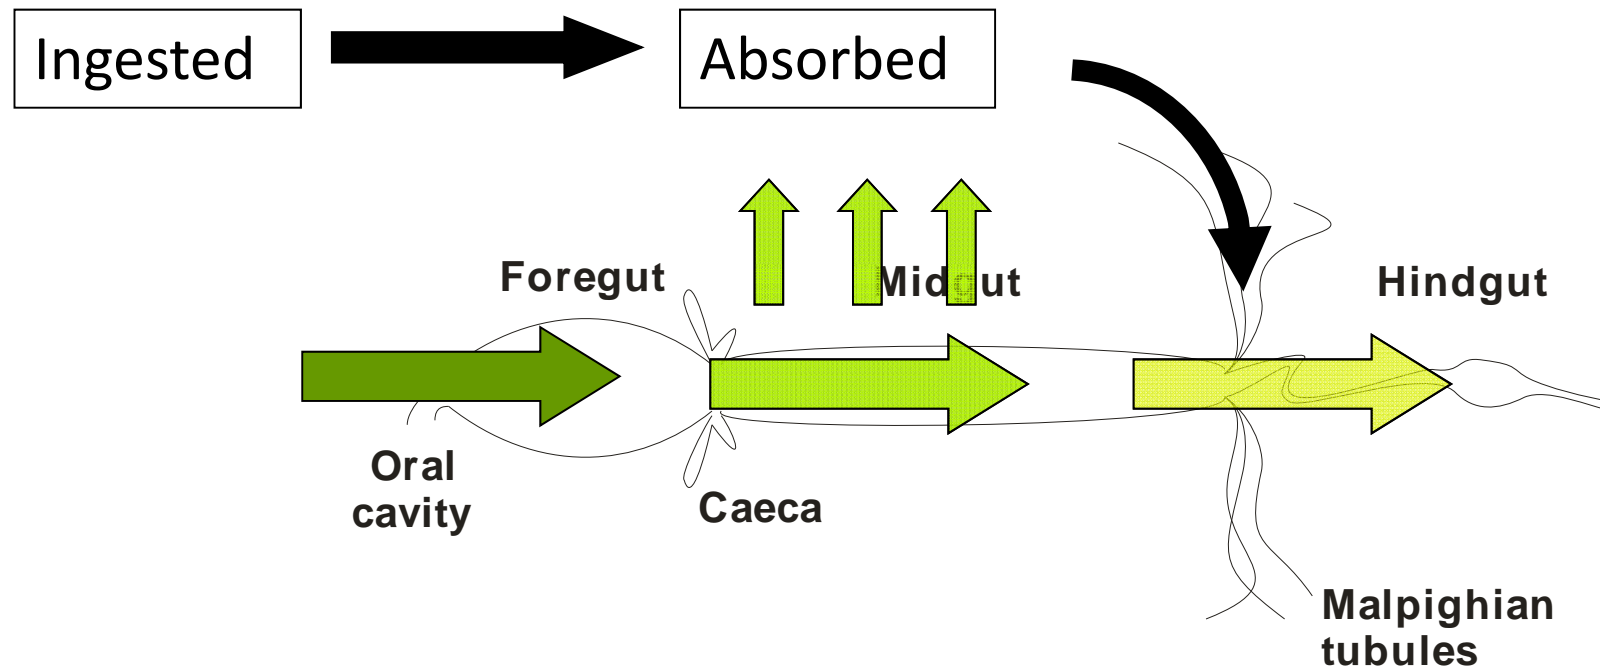

phloem = sugar & water > nitrogen

Filter chamber: modified gut to allow water and simple sugars to bypass midgut

NUTRITION = IN - OUT

Nutrition = ingestion – not absorbed – losses via post absorptive processing

Post – ingestive balancing

- **Pre-absorptive**

- Differential release of digestive enzymes

- (Clissold et al. 2010)

- Change in alimentary canal morphology

- (Raubenheimer and Bassil 2007)

- Altered transporters?

- **Post-absorptive**

- Metabolism/Excretion

- Deamination of amino acids (change N-compounds to C-compounds), excrete excess N

- Dietary induced thermogenesis (removal of excess C-energy)

- Excretion of inorganic ions

Example: *physiological*

NUTRITION = **IN** – **OUT** - *not absorbed*

Differential release of enzymes

Herbivores (& Carnivores)

e.g. *Locusta migratoria*

extraoral digesters??

Example: *physiological*

$$\text{NUTRITION} = \text{IN} - \text{OUT} - \text{not absorbed}$$

Locusta migratoria

Ingested

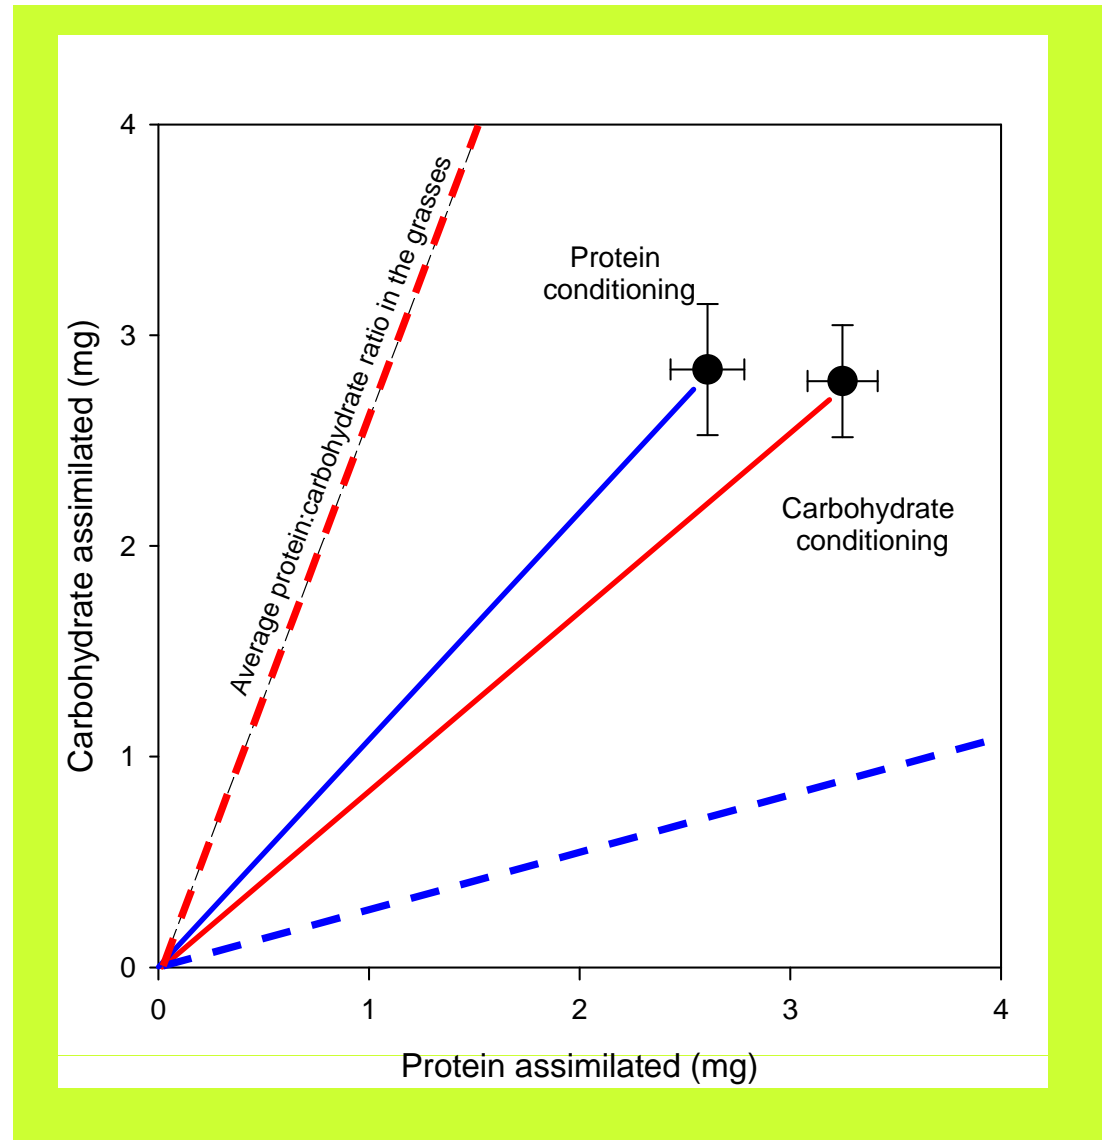

Pc pC Pc pC

Pc pC Pc pC

Example: *physiological*

Locusta migratoria

Example: *physiological / behavioural*

$$\mathbf{NUTRITION} = \mathbf{IN} - \mathbf{OUT}$$

post absorptively removed

Protein - demainate and excrete N,
use the CHO backbone as energy

C-based (carbohydrate and lipid)

- increase metabolic rate

Example: *morphological / physiological*

$$NUTRITION = \boxed{IN} - OUT$$

Symbionts

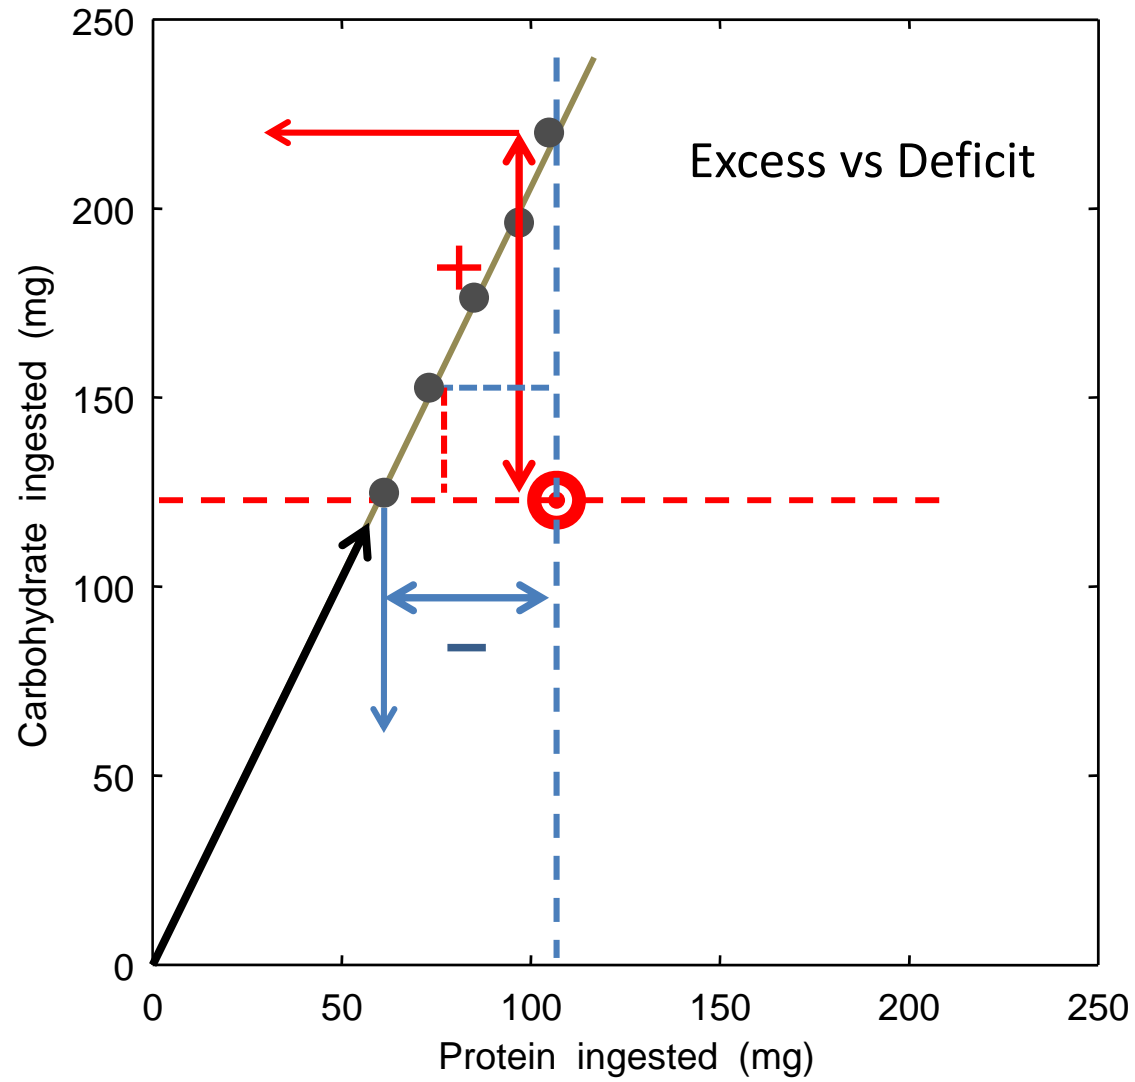

- extra- or intracellular microorganisms
(bacteria, yeast, protists, fungi).
- Contribute to the insects nitrogen (a.a. synthesis),
vitamin, sterol and/or carbohydrate economy

Post-ingestive balancing

can only do so much

What happens when insects are forced to eat a suboptimal diet?

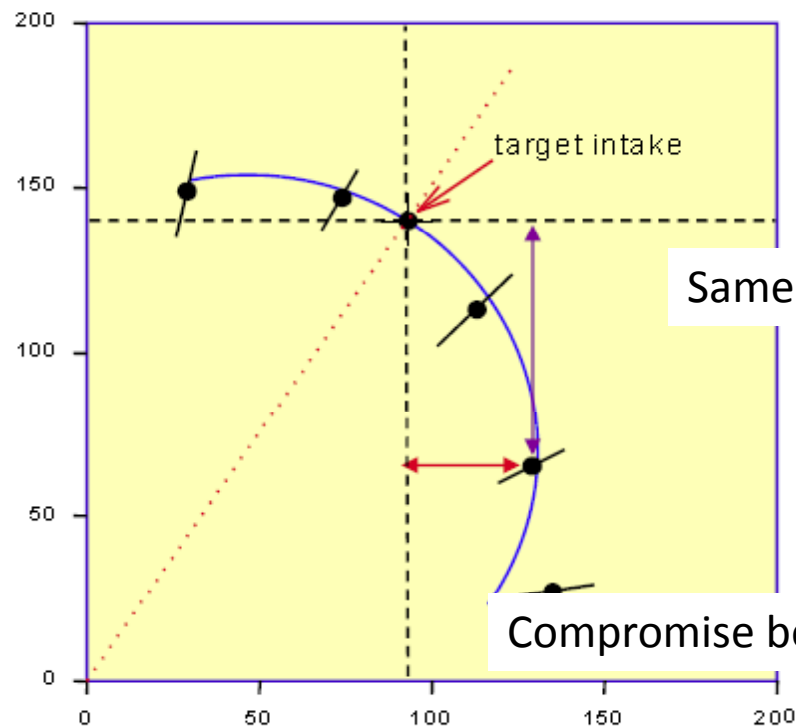

Excess vs Deficit

- Rules**
- Excess > Deficit
 - Excess = Deficit
 - Excess < Deficit

Specialist feeder

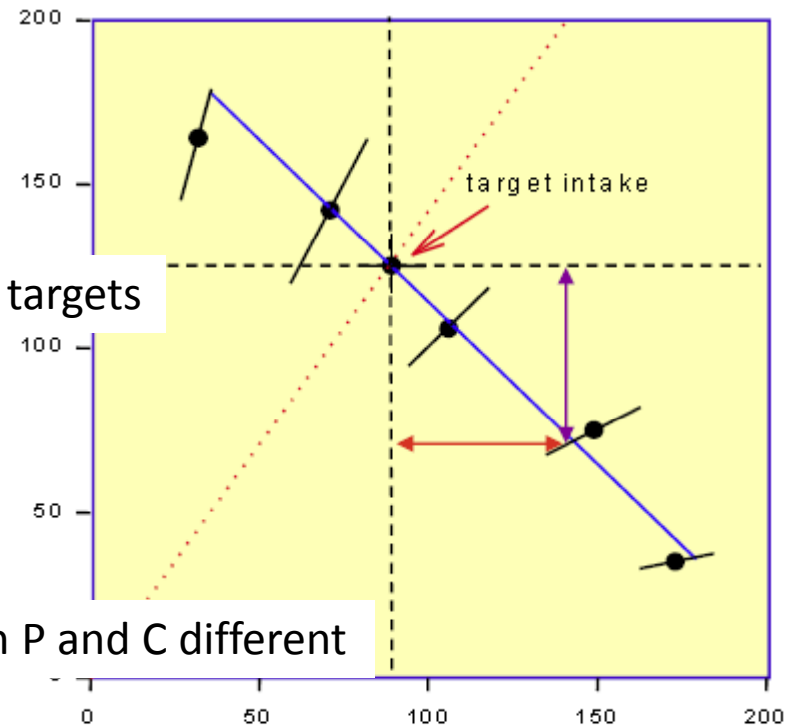

e.g. *Locusta migratoria*,
grass feeding specialist

Excess < Deficit

Generalist feeder

e.g. *Schistocerca gregaria*,
feeds on grasses and forbs

Excess = Deficit

Regulation of nutrient intake requires

- 1) Assessment or knowledge of the nutrient composition of foods
 - directly by tasting
 - learning

- 2) Knowledge of the nutritional status of the insect
 - haemolymph composition
 - status of nutrient reserves e.g. fat stores

- 3) A method of comparing food and state
 - Controlled by the sensitivity of *peripheral taste receptors* which are regulated by metabolic and physiological feedbacks
 - learning from previous experience

Summary

Diet choice

- Nutrient requirements
- Age
- Previous history
- Environment
 - phagostimulants
 - deterrents
- Predators/microhabitat/etc

Ingestion

- Meal size

Assimilation allocated to growth

- Costs of
 - Metabolic requirements
 - Diet processing and digestion
 - Behaviour

Excretion

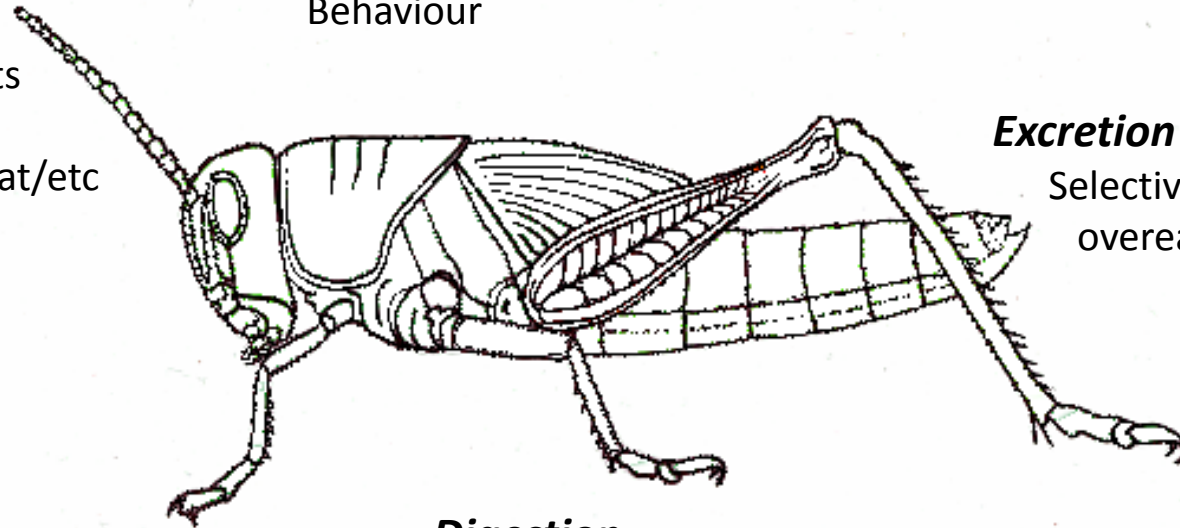

- Selective egestion of overeaten compounds

Processing

- Ease of extraction
- Mandible sharpness

Digestion

- Food retention time
- Selective uptake – differential release of nutrients

Summary

Nutrition

what insects need

how do insects balance demand and supply
